### Classification and Regressic reatlearning

#### Decision Trees can be used for both

<b>X1</b> ‡	<b>X2</b> ‡	<b>Y</b>
0.268	0.266	Bad
0.219	0.372	Bad
0.517	0.573	Bad
0.269	0.908	Good
0.181	0.202	Bad
0.519	0.898	Good
0.563	0.945	Bad
0 129	0 661	Rad

#### Classification

- Spam / not Spam
- Admit to ICU /not
- Lend money / deny
- Intrusion detections

#### X2 <sup>‡</sup> Y X1 0.268 0.266 64.41 0.219 0.372 28.08 0.517 0.573 95.76 0.269 0.908 15.84 0.181 0.202 41.83 0.519 0.898 25.20 0.563 0.945 9.44 Λ 12Q 0.661 82 77

### Regression

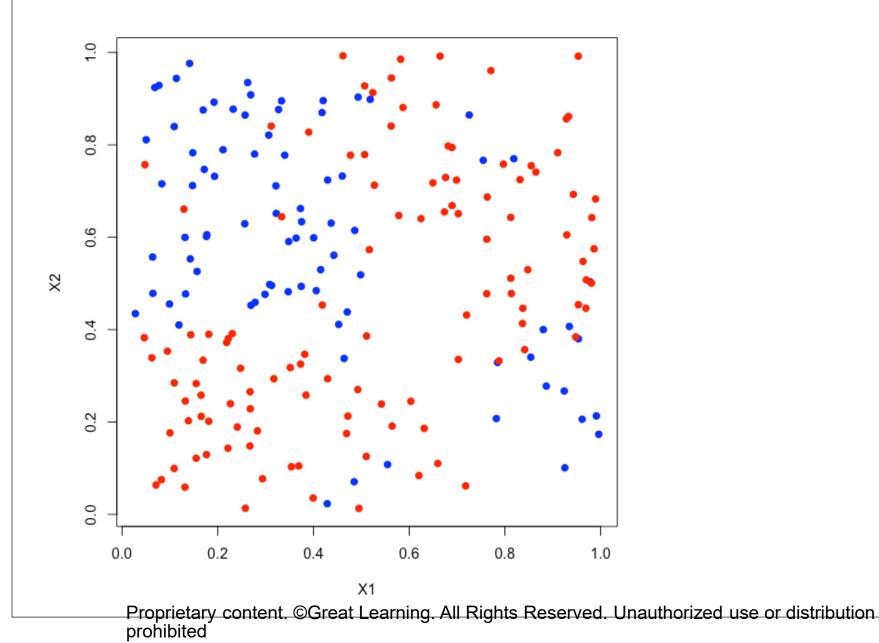

- Predict stock returns
- Pricing a house or a car
- Weather predictions (temp, rain fall etc)
- Economic growth predictions
- Predicting sports scores

### **Decision Trees**

- The general idea is that we will segment the space into a number of simple regions.
- The segmentation can be illustrated as a tree
- The end nodes can have a category (classification) or a continuous number (regression)
- These methods, while quite simple are very powerful.

# Visualizing Classification as a **greatlearning** for Life

### Metrics

- Algorithms for constructing decision trees usually work topdown, by choosing a variable at each step that best splits the set of items.
- Different algorithms use different <u>metrics</u> for measuring "best"
- These metrics measure how similar a region or a node is.
   They are said to measure the impurity of a region.
- Larger these impurity metrics the larger the "dissimilarity" of a nodes/regions data.
- Examples: Gini impurity, Entropy, Variance

### Algorithms for building Decision **greatlearning** for Life

- Popular ones include
  - CART (Classification And Regression Tree)
  - C4.5
  - CHAID (CHi-squared Automatic Interaction Detector)

• We will focus on CART, that uses the Gini impurity as its impurity measure.

### CART: An Example

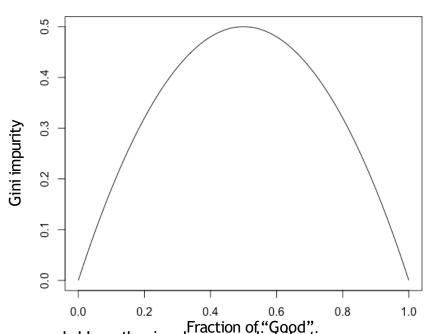

Cust_ID	Gender	Occupati on	Age	Target
1	М	Sal	22	1
2	М	Sal	22	0
3	М	Self-Emp	23	1
4	М	Self-Emp	23	0
5	М	Self-Emp	24	1
6	М	Self-Emp	24	0
7	F	Sal	25	1
8	F	Sal	25	0
9	F	Sal	26	0
10	F	Self-Emp	26	0

### Gini impurity

- Used by the CART
- Is a measure of how often a randomly chosen element from the set would be incorrectly labeled if it was randomly labeled according to the distribution of labels in the subset.
- Can be computed by summing the probability of an item with label i being chosen  $(p_i)$ , times the probability of a mistake  $(1-p_i)$  in categorizing that item.
- Simplifying gives, the Gini impurity of a set:

$$1 - \sum_{i=1}^{X^{J}} p_i^2$$

## Splitting using Gini impurity reatlearning Learning for Life

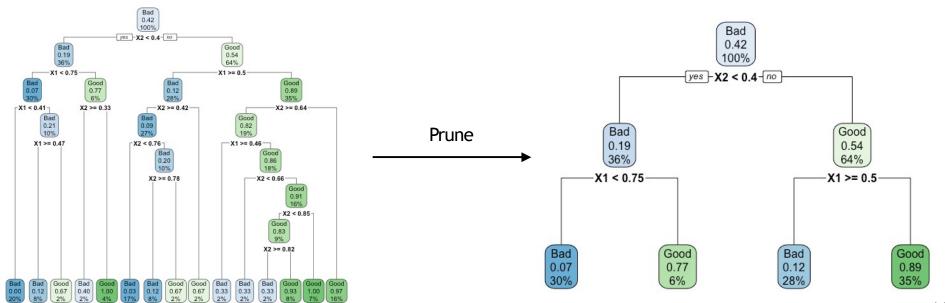

- When splitting, the Gini impurity of the two resulting nodes are combined using a weighted average.
- With weights being the fraction of data on each node.
- The CART algorithm simply chooses the right "split" by finding the split that maximizes the "decrease in Gini impurity" - also called the Gini Gain.

### Pruning

- Ideally we would like a tree that does not over-fit the given data
- Pruning can be achieved by saying that each split needs to decreases error by at least amount.
- Cost complexity pruning is the most common at it chooses a CP parameter and requires each split to decrease relative error by at least that amount

11

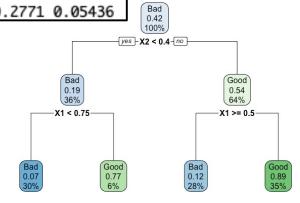

### Pruning

Prune with  $\leftarrow$   $\leftarrow$  0.15

```
CP nsplit rel error xerror xstd
1 0.325301 0 1.0000 1.0000 0.08395
2 0.084337 2 0.3494 0.3494 0.05999
3 0.012048 3 0.2651 0.2771 0.05436
```

### **Cross Validation**

- Cross Validation is a common Machine Learning technique that splits the data into n non-overlapping groups, and runs n experiments:
  - In each experiment, n-1 groups are used to train a model and the model is tested on the left out group.
  - The results are summarized over the n experiments.
- It gives a mechanism that allows us to test a model repeatedly on data that was not used to build the model.
- For Decision Trees, a very common approach is simply to choose the tree with minimum cross validation error

				1		1
	CP	nsplit	rel error	xerror	xstd	
	1 0.325301	0	1.0000	1.0000	0.08395	
	2 0.084337	2	0.3494	0.3494	0.05999	
<	3 0.012048	3	0.2651	0.2771	0.05436	
	4 0.008032	5	0.2410	0.3133	0.05730	
	5 0.006024	8	0.2169	0.3133	0.05730	
	6 0.000000	14	0.1807	0.4217	0.06474
